Exxonmobile test (2014 / 10 / 31)

1) What is a daemon?

2) Write three file names needed for inetd to work.

3) How can you enable a client machine to reach a subdirectory of another machine via net? (What's the name of the protokol, what is the correct order of the differect steps – both on the client, and on the server side.)

4) What's the name and the functionality of the 3rd level in the OSI reference model?

5) Write the command which you have to use to configure Layer 2 address of an interface on HP-UX 11iV2 and 11iV3.

6) After configuring the L2 address, what're the next steps?

7) How can you check that there is correct link between 2 different HP-UX machines? (11iV2/11iV3)

8) How many different types of name servers are available? Please describe them.

9) What is single-sign-on, and what steps are needed to configure it with SSH?
